

01076024 Software Architecture Design Semester 1, 2021

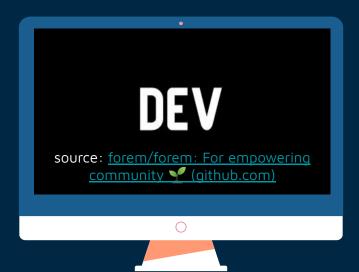

# TABLE OF CONTENTS

# Project Explanation

# **Project Explanation**

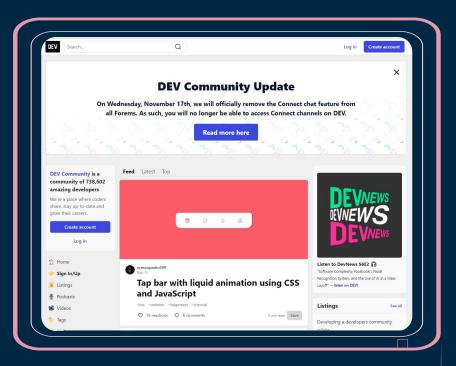

Forem is open source software for building communities. Communities for your peers, customers, fanbases, families, friends, and any other time and space where people need to come together to be part of a collective

## Who use Forem?

It is a community of software developers who write articles, take part in discussions, and build their professional profiles.

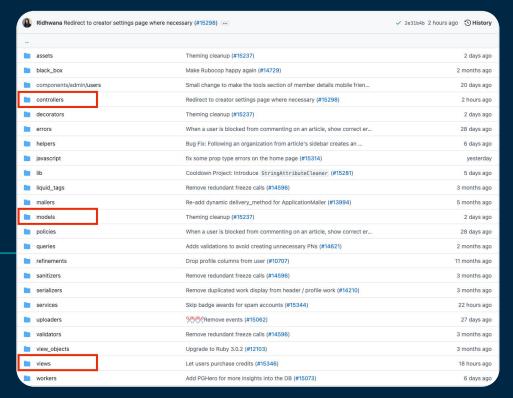

source: <u>forem/forem: For empowering</u> <u>community (qithub.com)</u>

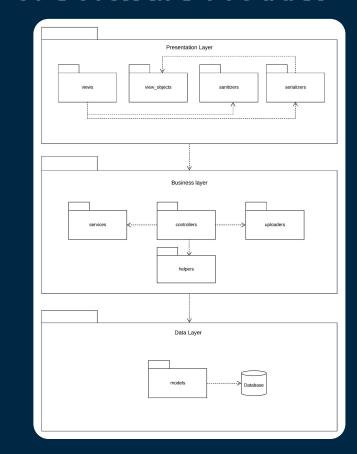

# Software Architecture & UML

# Architecture of Software Product

### Model View Controller (MVC)

# Architecture of Software Product

# Quality Attribute

# **Quality Attribute**

Usability

Scalability

Singleton

Weakness and Tactics

# Usability

### Supporting reason

We have methodically built certain important features while also rushing some things and throwing some things at the wall to see if they stick. That's the nature of building a software project, a community, and a company all at the same time.

### Tactics

Forem builds various modules to use the Website from the very beginning.

### Proofs

<u>For Empowering Community - DEV Community</u> (What does Forem do?)

# **Testability**

Forem can support many types of testing such as Acceptance Test Integration, Test Unit Test etc.

### Tactics

Forem uses Rails's test system in Ruby language, and uses jest in Javascript and can also test some parts of the system for users to follow.

### Proofs

**Acceptance Testing** 

# Compatibility

### Supporting reason

Forem to be highly compatible with one another in order to build a cohesive ecosystem where members of multiple Forem can move seamlessly between community apps — even if those apps do not share any data about the individual.

### Tactics

Forem builds its own class base, allowing models built on the platform to easily migrate between applications created by Forem.

### **Proofs**

<u>For Empowering Community - DEV Community</u> (What is Forem?)

## Weakness & Tactics

Performance

### Description

Forems base on Ruby on Rails and Handle usage to finish by yourself that has issues when the website is heavily loaded.

### Tactics

Add other support in Architecture such as static file service, load balance, database.

# Design Pattern
